

Vision Statement

Write by Ortal Hanoach, Tomer Maabari and Mulugeta Fanta

November 2020

In the past year humanity is coping with the COVID19(Corona virus) and we saw a need to help with this problem. Our project allows users to track and identify people via camera if a person wears a mask or not, gender, age, skin color. (Users like: Market shops, Security facilities etc.)

With large datasets of over 4000 images of people all around the world with and without a mask, we will be able to recognize on real time new faces and classify them. Using neurons and deep learning machine.
